

# STRADIVARI® WMS

## Warehouse Management System

Stradivari® WMS is the system validated warehouse management system for medium-sized companies and corporate groups. The system supports current Windows and Android operating systems and is established as a market-tested and innovative process solution in many industries.

The innovative module design offers you the necessary security of investment and will provide you efficient functions for your competitiveness in future's business. These include AI-based planning and transport optimization, and computer vision concepts that can be used to eliminate scanning processes. Track & Trace in production, container management and dynamic ABC control are further features of Stradivari.

With for instance yard management, real-time localization and transport control system the WMS also integrates efficient add-ons for holistic process digitization and offers flexible connections to provision systems, e.g. Kardex.

You receive increased transparency by intelligent warehouse handling and you are able to identify cost drivers in your logistics at any time.

You benefit from the complete system integration from one single source - consisting of WMS software, hardware as well as data radio installations and software support.

**WE ARE THE SUPPLY CHAIN ARCHITECTS.**

## SPEED, PROCESS RELIABILITY AND TRANSPARENCY

You have to design the handling for your customers fast, reliable and transparent and have to inform your customers proactive. Every second counts. The warehouse management system Stradivari® supports you to design your tasks more efficient.

Stradivari shows its strengths particularly in storage and order picking with mobile data capturing. The graphical control station with real-time tracking offers the logistics manager a comprehensive controlling tool and tailored functions such as multi-warehouse and multi-client capability. Thanks to distributed picking, different resources can be controlled individually and orders can be processed in parallel.

Functions like batch management, serial number management, MHD-/best-before control, parts lists and set products are just a few examples for the performance of your new warehouse management system. The assembly module supports your value-added service processes and the yard management optimizes your receiving lead times.

In addition to a graphical cockpit for each client, Stradivari offers extensive options for evaluations: e.g. according to the age of the stock, returns according to quality criteria, picks per day, picks per employee, storage locations per client. Get maximum control to measure your own performance and that of your suppliers as well as create customer-specific proofs of performance.

Stradivari is used as a stand-alone solution or in connection with ERP systems such as SAP ERP or Microsoft Dynamics NAV. Stradivari can be flexibly adapted to your system environment and is integrated as a cloud solution or on-premise solution as required.

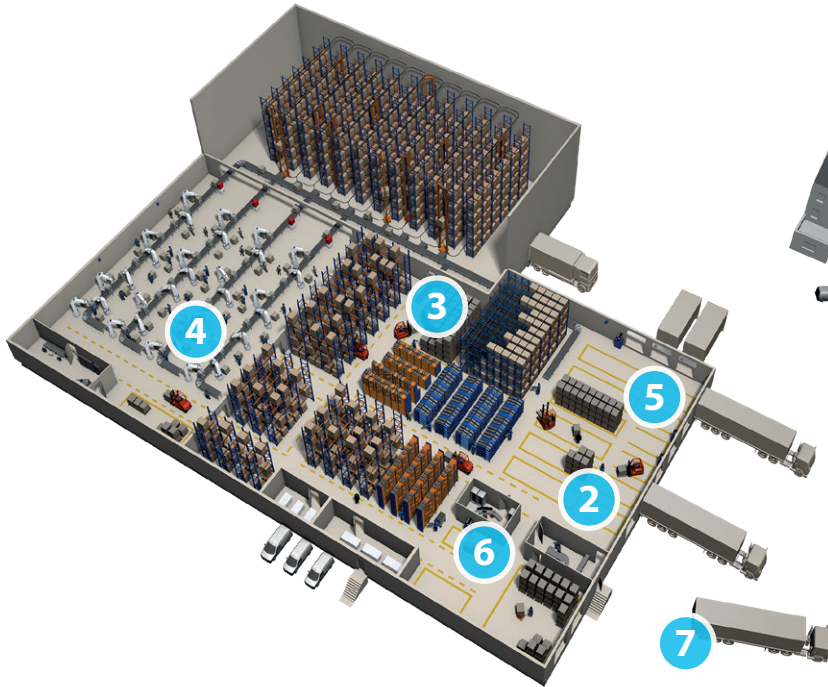

## Customer Benefit

- Increase in storage capacity through efficient automation of storage, restocking and replenishment rules.
- You will receive a modern, multi-client capable and fast solution with which you can serve your customers more reliably.
- You integrate Stradivari flexibly via cloud or on-premise. The scalable cloud solution adapts to your workload and thus optimizes your cost-benefit ratio.
- You will receive a warehouse management solution tailored to your needs with efficient features for logistics 4.0.
- You get complete transparency through various dashboards and graphic evaluations.
- Increase your customer satisfaction by gaining agility and productivity as well as seamless track & trace across the entire supply chain.
